

PRESS RELEASE

HOT WIRELESS ANNOUNCES THEIR FOURTH UTILITY PATENT **SIGNAL BOOSTERS IN YOUR FAVORITE CLOTHES!**

San Diego, November 29, 2018: Hot Wireless, a veteran-owned, San Diego-based company announces a new utility patent has been awarded for its technology that will enable inclusion of their wireless, signal boosters in clothing.

The technology boosts cell phone, WiFi & Bluetooth signals without the need for power of any kind, or cables. There are no apps to download or synchronize and the technology works with cellular and WiFi/Bluetooth devices. Although there are no contracts required, the technology works with cell & WiFi service providers.

Hot Wireless is actively seeking licensing and/or manufacturing agreements with US-based clothing manufacturers. Hot Wireless products are made in the USA.

Imagine heading out for a run...slip on a Hot Wearable™ jacket, t-shirt and/or hat and put a cell phone in the arm band. Available signals will be boosted to make a calls, listen to music, download a movie, send a text, etc.

Headed to the office? Any dead spots on that commute? Almost every office has areas with weak signal strength. Wear a Hot Wearable™ jacket, or shirt/blouse to have boosted signals available throughout the day.

The patented technology is perfect for incorporating into clothing; jackets & shirts, jeans and pants, hats & bags. It is thin, flexible, machine washable & dry cleanable.

Hot Wireless President, Skylar Walker, notes, "... having cell/WiFi signal boosters built into your favorite clothes means that you will have a wireless signal booster with you, all the time. Like our Hottie® Products, the signal booster clothing will require no batteries, cables, or service contracts and it will boost cell, Bluetooth/WiFi signals..."
